List of Tables

1	Table of VnV Teammates	3
2	Table of VnV Roles	3

2 Symbols, Abbreviations, and Acronyms

The Symbols, Abbreviations, and Acronyms in this document builds upon those from BeamBending’s related SRS document [\[1\]](#).

Symbol	Description
CAS	Computing and Software department (McMaster University)
SRS	Software Requirements Specification
T	Test
VnV	Verification and Validation

3 General Information

This document describes the plan of action related to the Verification and Validation (VnV) of the Beam Bending analysis program (BeamBending). This VnV plan will describe a plan of action for *validating* that the Software Requirements Specification (SRS) [1] for BeamBending satisfies stakeholders, and *verifying* that a supposedly conforming software does indeed accurately satisfy the requirements.

3.1 Summary

The BeamBending Software Requirements Specification (SRS) [1] derives the software requirements of a hypothetical program that solves deflection analysis problems for simply-supported beams. The focus of the program is to predict how simply-supported beams handle imposed, distributed loads.

3.2 Objectives

The objective of this document is to outline a plan of action for:

1. *auditing* a continuously developed SRS document [2] for logical consistency,
2. *validating* said SRS satisfies stakeholder requirements, and
3. *verifying* that a produced software artifact conforms everything laid out in the SRS document (including, but not limited to, the functional and nonfunctional requirements), through both transparent and opaque testing.

In doing this, we hope to build confidence in the coherence of software requirements, and correctness and conformance of a software to said specifications.

3.3 Relevant Documentation

As we intend to build (generate) the software with Drasil, the only relevant documentation is that which is originally manually built, including:

1. the SRS document [1], and

2. this VnV plan.

When the BeamBending program is re-created in Drasil, we may think of that as a sort of “documentation” that we can to the above list.

4 Plan

The “whole” Verification and Validation plan for BeamBending consists of multiple sub-plans. Notably, it has a designated team (with sub-teams) who will be executing the related sub-plans stipulated in this document. Team members will take responsibility for various aspects of verification and validation.

4.1 Verification and Validation Team

Table 1: Table of VnV Teammates

Assignee	Project	Role(s)
Dr. Smith	* ¹	Authoritative Expert ² .
Jason Balaci	*	Author.
Sam Crawford	*	Reviewer and VnV-er.
Mina Mahdipour	SRS	Reviewer.
Deesha Patel	VnV	Reviewer.
Maryam Valian	Drasil	Reviewer & VnV-er.
Class of CAS 741	*	*

Table 2: Table of VnV Roles

Role	Description/responsibilities
Authoritative Expert	Manager of all review committees and distinguished reviewer.
Domain Expert	
Author	
Reviewer	
Verifier	
Validator	

¹ *: match all.

² Pretend we’re not in CAS 741.

4.2 SRS Verification Plan

In addition to checking that BeamBending's Software Requirements Specification (SRS) conforms to Dr. Smith's provided SRS checklist, we will have:

1. a designated reviewing committee with a governing authoritative expert,
2. a public presentation with a reviewing audience,
3. built the project in Drasil, where we can build automated consistency checks and generate certain aspects of the document to avoid error,
4. at least one external reviewer (Dr. Jacques Carette of the Drasil project) when the whole BeamBending project is sent to the main Drasil repository for merging, and finally,
5. regular updates and sporadic reviews by current and future Drasil team members and onlookers (assuming the project is merged as an official case study of Drasil).

4.3 Design Verification Plan

The software design does not need verification as the design of the software will be based on Drasil's existing software family generator [3]. The onus of Drasil's validation is up to the Drasil team.

JB:
Well,
I am extending
Drasil a
bit.

4.4 Verification and Validation Plan Verification Plan

[TPLT — The verification and validation plan is an artifact that should also be verified.]

[TPLT — The review will include reviews by your classmates]

[TPLT — Create a checklists?]

4.5 Implementation Verification Plan

[TPLT — You should at least point to the tests listed in this document and the unit testing plan.]

[TPLT — In this section you would also give any details of any plans for static verification of the implementation. Potential techniques include code walkthroughs, code inspection, static analyzers, etc.]

4.6 Automated Testing and Verification Tools

[TPLT — What tools are you using for automated testing. Likely a unit testing framework and maybe a profiling tool, like ValGrind. Other possible tools include a static analyzer, make, continuous integration tools, test coverage tools, etc. Explain your plans for summarizing code coverage metrics. Linters are another important class of tools. For the programming language you select, you should look at the available linters. There may also be tools that verify that coding standards have been respected, like flake9 for Python.]

[TPLT — If you have already done this in the development plan, you can point to that document.]

[TPLT — The details of this section will likely evolve as you get closer to the implementation.]

4.7 Software Validation Plan

[TPLT — If there is any external data that can be used for validation, you should point to it here. If there are no plans for validation, you should state that here.]

[TPLT — You might want to use review sessions with the stakeholder to check that the requirements document captures the right requirements. Maybe task based inspection?]

[TPLT — This section might reference back to the SRS verification section.]

5 System Test Description

5.1 Tests for Functional Requirements

[TPLT — Subsets of the tests may be in related, so this section is divided into different areas. If there are no identifiable subsets for the tests, this level of document structure can be removed.]

[TPLT — Include a blurb here to explain why the subsections below cover the requirements. References to the SRS would be good here.]

5.1.1 Area of Testing1

[TPLT — It would be nice to have a blurb here to explain why the subsections below cover the requirements. References to the SRS would be good here. If a section covers tests for input constraints, you should reference the data constraints table in the SRS.]

Title for Test

1. test-id1

Control: Manual versus Automatic

Initial State:

Input:

Output: [TPLT — The expected result for the given inputs]

Test Case Derivation: [TPLT — Justify the expected value given in the Output field]

How test will be performed:

2. test-id2

Control: Manual versus Automatic

Initial State:

Input:

Output: [TPLT — The expected result for the given inputs]

Test Case Derivation: [TPLT — Justify the expected value given in the Output field]

How test will be performed:

5.1.2 Area of Testing2

...

5.2 Tests for Nonfunctional Requirements

[TPLT — The nonfunctional requirements for accuracy will likely just reference the appropriate functional tests from above. The test cases should mention reporting the relative error for these tests. Not all projects will necessarily have nonfunctional requirements related to accuracy]

[TPLT — Tests related to usability could include conducting a usability test and survey. The survey will be in the Appendix.]

[TPLT — Static tests, review, inspections, and walkthroughs, will not follow the format for the tests given below.]

5.2.1 Area of Testing1

Title for Test

1. test-id1

Type: Functional, Dynamic, Manual, Static etc.

Initial State:

Input/Condition:

Output/Result:

How test will be performed:

2. test-id2

Type: Functional, Dynamic, Manual, Static etc.

Initial State:

Input:

Output:

How test will be performed:

5.2.2 Area of Testing²

...

5.3 Traceability Between Test Cases and Requirements

[TPLT — Provide a table that shows which test cases are supporting which requirements.]

6 Unit Test Description

[TPLT — Reference your MIS (detailed design document) and explain your overall philosophy for test case selection.] [TPLT — This section should not be filled in until after the MIS (detailed design document) has been completed.]

6.1 Unit Testing Scope

[TPLT — What modules are outside of the scope. If there are modules that are developed by someone else, then you would say here if you aren't planning on verifying them. There may also be modules that are part of your software, but have a lower priority for verification than others. If this is the case, explain your rationale for the ranking of module importance.]

6.2 Tests for Functional Requirements

[TPLT — Most of the verification will be through automated unit testing. If appropriate specific modules can be verified by a non-testing based technique. That can also be documented in this section.]

6.2.1 Module 1

[TPLT — Include a blurb here to explain why the subsections below cover the module. References to the MIS would be good. You will want tests from a black box perspective and from a white box perspective. Explain to the reader how the tests were selected.]

1. test-id1

Type: [TPLT — Functional, Dynamic, Manual, Automatic, Static etc. Most will be automatic]

Initial State:

Input:

Output: [TPLT — The expected result for the given inputs]

Test Case Derivation: [TPLT — Justify the expected value given in the Output field]

How test will be performed:

2. test-id2

Type: [TPLT — Functional, Dynamic, Manual, Automatic, Static etc.
Most will be automatic]

Initial State:

Input:

Output: [TPLT — The expected result for the given inputs]

Test Case Derivation: [TPLT — Justify the expected value given in
the Output field]

How test will be performed:

3. ...

6.2.2 Module 2

...

6.3 Tests for Nonfunctional Requirements

[TPLT — If there is a module that needs to be independently assessed for performance, those test cases can go here. In some projects, planning for nonfunctional tests of units will not be that relevant.]

[TPLT — These tests may involve collecting performance data from previously mentioned functional tests.]

6.3.1 Module ?

1. test-id1

Type: [TPLT — Functional, Dynamic, Manual, Automatic, Static etc.
Most will be automatic]

Initial State:

Input/Condition:

Output/Result:

How test will be performed:

2. test-id2

Type: Functional, Dynamic, Manual, Static etc.

Initial State:

Input:

Output:

How test will be performed:

6.3.2 Module ?

...

6.4 Traceability Between Test Cases and Modules

[TPLT — Provide evidence that all of the modules have been considered.]

7 Appendix

7.1 Symbolic Parameters

There are no symbolic constants (nor parameters) needed for BeamBending.

7.2 Usability Survey Questions

As the project will rely on Drasil to build the software from the requirement description, any and all “usability” and/or “accessibility” concerns should be directed towards the Drasil team as BeamBending will only use their basic (stable) public-facing tooling.
